Lab Name: Design Analysis & Algorithms

Write a C program to implement Prim's algorithm to find Minimum Spanning Tree.

Suppose the graph that given solution below

```
#include <limits.h>
#include <stdbool.h>
#include <stdio.h>
// Number of vertices in the graph
#define V 5

// A utility function to find the vertex with
// minimum key value, from the set of vertices
// not yet included in MST
int minKey(int key[], bool mstSet[])
```

```
// Initialize min value
    int min = INT_MAX, min_index;
    for (int v = 0; v < V; v++)
        if (mstSet[v] == false && key[v] < min)</pre>
            min = key[v], min_index = v;
    return min_index;
// constructed MST stored in parent[]
int printMST(int parent[], int graph[V][V])
    printf("Edge \tWeight\n");
   for (int i = 1; i < V; i++)
        printf("%d - %d \t%d \n", parent[i], i, graph[i][parent[i]]);
// Function to construct and print MST for
// a graph represented using adjacency
// matrix representation
void primMST(int graph[V][V])
   int parent[V];
   // Key values used to pick minimum weight edge in cut
    int key[V];
    // To represent set of vertices included in MST
   bool mstSet[V];
    // Initialize all keys as INFINITE
   for (int i = 0; i < V; i++)
        key[i] = INT_MAX, mstSet[i] = false;
    // Always include first 1st vertex in MST.
    // Make key 0 so that this vertex is picked as first vertex.
    key[0] = 0;
    parent[0] = -1; // First node is always root of MST
    for (int count = 0; count < V - 1; count++) {</pre>
        // Pick the minimum key vertex from the
        // set of vertices not yet included in MST
        int u = minKey(key, mstSet);
        mstSet[u] = true;
        for (int v = 0; v < V; v++)
```

Output
